

DTM68300A

32GB - 288-Pin 4Rx4 Load Reduced ECC DDR4 LRDIMM

Features

288-pin JEDEC-compliant DIMM, 133.35 mm wide by 31.25 mm high

Operating Voltage: VDD/VDDQ = 1.2V (1.14V to 1.26V)

VPP = 2.5V (2.375V to 2.75V)

VDDSPD = 2.25V to 2.75V

I/O Type: 1.2 V signaling

On-board I²C temperature sensor with integrated Serial Presence-Detect (SPD) EEPROM

Data Transfer Rate: 17.0 Gigabytes/sec

Data Bursts: 8 and burst chop 4 mode

ZQ Calibration for Output Driver and On-Die Termination (ODT)

Programmable ODT / Dynamic ODT during Writes

Programmable CAS Latency: 9, 11, 12, 13, 14, 15 and 16

Bi-directional Differential Data Strobe signals

Per DRAM Addressability is supported

Write CRC is supported at all speed grades

ALERT Flag Supported

CA parity (Command/Address Parity) mode is supported

Supports ECC error correction and detection

16 Internal Banks (4 Bank Groups)

SDRAM Addressing (Row/Col/BG/BA): 16/10/2/2

Fully RoHS Compliant

Description

DTM68300A is a load reduced 4Gx72 memory module, which conforms to JEDEC's DDR4-2133, PC4-2133 standard. The assembly is Quad-Rank. Ranks are comprised of Samsung 2Gbx4 DDR4-2133 DDP SDRAMs. One 4K-bit EEPROM is used for Serial Presence Detect and a Registering Clock Driver, with Address and Command Parity, is also used as well as data buffers to reduce the overall loading on the data bus.

Both output driver strength and input termination impedance are programmable to maintain signal integrity on the I/O signals in a Fly-by topology. A thermal sensor accurately monitors the DIMM module and can prevent exceeding the maximum operating temperature of 95C.

Speed Bin Table Notes:

Absolute Specification

- VDDQ = VDD = 1.20V +/- 0.06 V
- VPP = 2.5V +0.25/-0.125 V
- The values defined with above-mentioned table are DLL ON case.
- DDR4-1600, 1866, 2133 and 2400 Speed Bin Tables are valid only when Geardown Mode is disabled.

1. The CL setting and CWL setting result in tCK(avg).MIN and tCK(avg).MAX requirements. When making a selection of tCK(avg), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(avg).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL – all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(avg) value (1.5, 1.25, 1.071, 0.938 or 0.833 ns) when calculating $CL [nCK] = tAA [ns] / tCK(avg) [ns]$, rounding up to the next 'Supported CL', where tAA = 12.5ns and tCK(avg) = 1.3 ns should only be used for CL = 10 calculation.
3. tCK(avg).MAX limits: Calculate $tCK(avg) = tAA.MAX / CL \text{ SELECTED}$ and round the resulting tCK(avg) down to the next valid speed bin (i.e. 1.5ns or 1.25ns or 1.071 ns or 0.938 ns or 0.833 ns). This result is tCK(avg). MAX corresponding to CL SELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. 'Optional' settings allow certain devices in the industry to support this setting however it is not a mandatory feature. Refer to supplier's data sheet and/or the DIMM SPD information if and how this setting is supported.
6. Any DDR4-2133 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. DDR4-1600 AC timing apply if DRAM operates at lower than 1600 MT/s data rate.
8. For devices supporting optional down binning to CL=9, CL=11 and CL=13, tAA/tRCD/tRPmin must be 13.5ns or lower. SPD settings must be programmed to match. For example, DDR4-1600K devices supporting down binning to 1333MT/s should program 13.5ns in SPD bytes for tAAmin (Byte 24), tRCDmin (Byte 25), and tRPmin (Byte 26). DDR4-1866M devices supporting down binning to 1333MT/s or DDR4-1600K should program 13.5ns in SPD bytes for tAAmin (Byte 24), tRCDmin (Byte 25), and tRPmin (Byte 26). DDR4-2133P devices supporting down binning to 1333MT/s or DDR4-1600K or DDR4-1866M should program 13.5ns in SPD bytes for tAAmin (Byte 24), tRCDmin (Byte 25), and tRPmin (Byte 26). tRCmin (Byte 27, 29) also should be programmed accordingly. For example, 48.5ns (tRASmin + tRPmin = 35ns+ 13.5ns) is set to supporting optional down binning CL=9 and CL=11.
9. CL number in parentheses, it means that these numbers are optional.
10. DDR4 SDRAM supports CL=9 as long as a system meets tAA(min).

Functional Diagram

Notes:

1. CK0_t, CK0_c terminated with 120Ω ± 5% resistor.
2. CK1_t, CK1_c terminated with 120Ω ± 5% resistor but not used.
3. Unless otherwise noted resistors are 22Ω ± 5%.

Notes:

1. ZQ resistors are 240Ω ±1%. For all other resistor values refer to the appropriate wiring diagram.
2. See the Net Structure diagrams for all resistors associated with the command, address and control bus.
3. TEN Pin of SDRAMs is tied to VSS
4. DQ stub resistors are 15Ω ±5%. For all other resistor values refer to the appropriate wiring diagram.
